

Collaboration Planning

1. Logging Time and Scheduling Plan
 - Figure out each others schedule, when would be best to work together when possible.
 - This will have to be flexible of course, but having a rough idea when work will be getting moved along is good.
2. Documentation Plan
 - Detailed README, information log and issues log. This would leverage simple markdown files and the github issues functionality.
3. Accountability Plan
 - Work items using perhaps a trello or kanban board. This information also captured in a changelog in the project repository.
4. Communication Plan
 - Figure out partners preferences. Perhaps a simple chat service like discord would suffice for general conversations and calls.
5. Shared Work Space Preferences
 - I say we use Github and also maybe set up dependency management either using Poetry or Renv/Golem. I would really prefer working locally on my machine and avoiding stuff like google colab.
6. Feedback Loops you will need
 - Any functions we write ourselves should have basic unit testing I think.
 - We should be able to record client meetings to ensure we don't miss anything.
 - Code should be done via branches with PRs before merging. This is to ensure we both understand what each other are doing and checking for problems.
7. Professional Growth Goals
 - I want to UNDERSTAND this project and problem space by the end of this semester. I care about documentation and knowledge.

Also I REALLY want to avoid an overreliance on AI code and stuff. I'm okay with checking with it occassionally, but we should understand the code we're writing and things we're saying.

I refuse to accept AI written documentation and README beyond it creating tedious things like tables.
